peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, condition are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis, characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, crebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive trauma, peptides are also used to modulate vascular permeability of in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to induced neovesels and lymphatic or brain. The peptides are used to induced by VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and

Identification of targeting peptides that can be used to treat diseases e.g. cancer and arthritis, by the BRASIL (Biopanning and Rapid Analysis of Selective Ligands) method comprises a single differential

Example 5; Page 75; 167pp; English.

centrifugation step.

```
of Selective Interactive Ligands) to obtain a targeting peptide. The BRASIL method of the invention involves: exposing a target to a phage display library in a first phase, exposing the first phase to a second phase; and separating the phage bound to the target from unbound phage. The BRASIL method of the invention allows cell phages to be separated. The BRASIL method of the invention allows cell phages to be separated to the target in a single differential centrifugation step. When compared to conventional cell panning methods, the BRASIL method shows a significant increase in recovery of specific phage and a substantial decrease in background. The BRASIL method is useful for identifying targeting peptides. The targeting peptides identified by the method of the invention are useful for treating disease states, such as disease; bacterial infection; viral infection; candiovascular disease and degenerative disease. The present mains acid sequence represents a cargeting peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel method for identifying disease targeting peptides. The method comprises exposing a sample from an organ, tissue or cell type of interest, to a phage display library and recovering phage bound to the sample (the phage expresses targeting peptides). The peptides identified by the method of the invention may
comprises a method (BRASIL - Biopanning and Rapid Analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying targeting peptides useful for treating e.g. diabetes mellitus, inflammatory diseases, cancer, or autoimmune diseases, comprises exposing a sample to a phage display library and recovering phage bound to the sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Targeting peptide; cancer; Hodgkin's disease; cytostatic; immunosuppressive; anti-inflammatory; antiarthrocolerotic; antidiatherocolerotic; antidiatherocolerotic; antidiatherocolerotic; antidiatherocolerotic; inflammatory disease; arthritis; atherosolerosis; cancer; autoimmune disease; bacterial infection; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

         antiatherosclerotic, antidiabetic, antibacterial and antiviral activities. The methods and composition are useful for identifying targeting peptides and one or more receptors for a targeting peptides. The respecting peptides are used for selective delivery of therapeutic agents, including gene therapy vectors and fusion proteins, to specific organs, tissues, or cell types in subject. The targeting peptide may also be used for treating diseases such as diabetes mellitus, inflammatory diseases, arthritis, atherosclerosis, cancer, autoimmune diseases, bacterial and viral infections and Hodgkin's disease. The present sequence represents a targeting peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Active immunization against angiogenic proteins, useful for treating e.g. tumors and inflammation, particularly contains vascular endothelial growth factor or its receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ophthalmological; gynecological; antiarteriosclerotic; virucide; hepatotropic; dermatological; antiarteriosclerotic; antipporiatic; antiarthritic; antithyroid; immunization; anglogenesis; vascular endothelial growth factor; VEGF; neuropilin; placental growth factor; VEGF; neuropilin; autoimmunity; eye disease; arthritis; endometriosis; arteriosclerosis; edema; hepatitis; Kaposi sarcoma; diabetes; psoriasis; rheumatoid arthritis; thyroiditis; diabetic retinopathy; transplant rejection; macular degeneration; neovascular glaucoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    proteins comprising administration of a vaccination composition (A), optionally containing an adjuvant, that comprises polypeptides (I) directly associated with an increase in angiogenesis, their variants,

their encoding polynucleotides (II). Angiogenesis-associated polypeptides are: members of the vascular endothelial growth factor (VEGF) family, especially the 121, 165 or 189 isoforms of VEGF-A, the 167 isoform of C VEGF-B, or VEGF-C or -D; a (co-) receptor of VEGF-A, the 167 isoform of cumors in a growth factor. (A) is used for treatment or prevention of tumors in mammals, particularly humans but also farm animals and pets, also many other conditions associated with excessive angiogenesis, specifically other conditions associated with excessive angiogenesis, specifically other conditions associated with excessive angiogenesis, acute or chronic inflammation, autoimmunity and eye diseases (claimed). Among the diseases that may be treated are arthritis, endometriosis, arteriosclerosis, formations diseases (heppatitis and Kaposi sarrooms), diabetes, psoriasis, theumatoid arthritis, thyroiditis, diabetes caping and angiofibroma. The method destroys cells that are the source of angiogenic proteins. The method destroys cells that are the source of angiogenic proteins rather than just neutralizing the activity of source of angiogenic proteins (as in passive immunization). This sequence represents an immunisation peptides of the invention derived from the VEGF proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for producing a compound library. The novel method involves reducing a biological target into a group of one or more amino acids required for interaction with a ligand, to generate a model of the biological target, using the model to define a microenvironment in the biological target capable of interacting with the ligand, defining motifs which interact with the microenvironment, and assembling the motifs to generate a compound library for synthesis. The novel method is useful to produce compound libraries for screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Producing compound library, by generating biological target model using target sequence information, defining microenvironments interacting with ligand and motifs interacting with microenvironment, and assembling motifs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compound library; microenvironment; G-protein Coupled Receptor; GPCR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The novel method involves reducing a biological target into a group of one or more amino acids required for interaction with a ligand, to one or more amino acids required for interaction with a ligand, to generate a model of the biological target capable of interacting the model to define a migrand defining motifs which interact with the microenvironment, and sasembling the motifs which interact with the microenvironment, and novel method is useful to generate a compound library for synthesis. The novel method is useful to produce compound libraries for synthesis. The natural ligands such as peptides and proteins or for producing chemical opposition of the producing chemical peptide of a G-protein Coupled Receptor (GPCR) including Endothelin ET-A receptor, which relates to the novel compound library production method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Producing compound library, by generating biological target model using target sequence information, defining microenvironments interacting with ligand and motifs interacting with microenvironment, and assembling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel method for producing a compound library.
natural ligands such as peptides and proteins or for producing chemical compounds based on drug motifs for screening. This sequence represents speptide of a G-protein Coupled Receptor (GPCR), which relates to the novel compound library production method of the invention
                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Compound library; microenvironment; G-protein Coupled Receptor; GPCR.

The present invention describes a method for Screening a figural indicative (LL). The method comprises: (a) contacting the LL with an anti-target (LL). The method comprises: (a) contacting the unbound ligands which a selected target (T) to allow binding of unbound ligands to (T) to form a (T)-bound ligand complex (C); (d) separating (C) from ligands which do not bind (T); and (e) identifying (T)-bound ligands on (C). The method can be used for core-ening a ligand library, e.g., a library of peptides, polypeptides, non-polypeptides or oligonucleotides. A ligand (I) identified by the method can be used in a cleaning, therapputic or personal care application. The method is preferably useful for identifying peptides (C) is pastic; separating unbound AT peptides; contacting peptides (Library with AT such as fabric, ceramic, glass, stainlass steel or plastic; separating unbound AT peptides; contacting unbound AT peptides; contacting unbound AT peptides (C) plastic; separating unbound AT peptides; contacting unbound AT peptides (C) plastic; separating unbound AT peptides; contacting peptide on the ataget which is a stain such as porphyrin derived stain, tannin derived stain, and contacting unbound AT peptides (C) plastic; separating unbound AT peptides; contacting unbound AT peptides (C) plastic (C) plastic (C) ataget which is a stain such as porphyrin derived stain, tannin derived stain, anthocyanin plument (C) the stain-bound peptide complex. A selective target may be used to allow unbound peptide complex and identifying the stain bound peptide complex. A selective target may be used to identify a tumour-bound ligand. The selective targeting method may be used to identify a tumour-bound ligand. The selective targeting method may be used to identify a tumour-bound ligand. The selective targeting method may be used to identify coll type specific surface molecules. Preferred anti-target induction, e.g., a library of ligands which are contacted to identify a tumour-bound ligand. The selective target may be used to ident
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening ligand library comprises allowing binding of ligand with antitarget, contacting unbound ligands with selected target to form target-bound ligand complex and identifying target bound ligands on the complex.
                                                                                                                                                                                                          Human, tumour necrosis factor alpha; TNF-alpha; VEGF; detergent, stain, bacteriophage; phage library; vascular endothelial growth factor; collar soil; polyurethane; egg; tea; hair; skin; cleaning composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present invention describes a method for screening a ligand library
                                                                                                                                                                Vascular endothelial growth factor binding peptide V-20 SEQ ID NO:98.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tijerina P, Chen Y;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 22; Page 28; 51pp; English.

The invertion may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel polypeptide encoded by an alternative

The invention relates to peptidic chemokine modulators for modulating a biological effect of a chemokine comprising a molecule composed of the amino acides histidine (H), serine (S), alanine (A), laucine (I), and proline (P), aloudine (I), arguine (R), arguine (R), and proline (P), and features an overall positive charge (family I) or a molecule composed of the amino acids H, P. T. L, R. Tryptophan (W), phenylalanine (F), and features an overall positive charge (family I) or a molecule composed of the amino acids H, P. T. L, R. Tryptophan (W), phenylalanine (F), and features an overall positive charge (family 2) and/or a molecule comprising a peptide having an amino acid sequence from a list, given in the specification. Also included are a composition for treating a comprising a peptide having abnormal cell migration in a subject (comprising a peptide having abnormal cell migration in a subject (comprising a disease modulated through and/or caused by binding of a chemokine to a disease modulated through and/or caused by binding to a chemokine receptor in a subject (by administering the therapeutic agent), an antibody for binding a chemokine-binding receptor (comprising the antibody for binding a chemokine-binding receptor (comprising the antibody for binding a chemokine-binding receptor), a vaccine formed with the antibody and a method for producing an antibody up inducing formation of antibody against a peptide having the sequence of the chemokine modulator, where the antibody is also capable of recognising a creceptor. The method, therapeutic agents and compositions are useful for treating a chemokine receptor, e.g. primary and secondary inflammation, allery, non chimal immune response, autoimmune reaction, allograft rejection, chaberes, sepais, cancer, any type of malignant cell growth, acute and chronic bacterial and viral infections, arbitist, colitis, psoriasis, atheracollery hypertension or reperfusion is chease modulatory chemokine respector. SDF-lalpha, MIG, cetaxin and interleukines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 9;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 29; DB 8; I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes an immunogenic peptide composition comprising 9 residues including a first conserved residue at a second position from N terminus, and a second conserved residue at C-terminal position. The inventive peptide composition is used to elicit an immune response against a desired antigen for preventing, treating or diagnosing pathological states, e.g. proseate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, carvical carcinoma, lymphoma, cytomegalovixus (CWV), and condlylloma acuminatum. It is also used to treat autoimmune associated disorders, e.g. multiple sclerosis, rheumatoid arthritis, Sjogren syndrome, scleroderma, polymyositis, dermatomyositis, systemic lupus erythematosus, juvenile rheumatoid arthritis, ankylosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunogenic peptide composition for preventing, treating or diagnosing pathological states, e.g. prostate cancer, hepatitis B and C, Acquired Immunodeficiency Syndrome, and renal carcinoma, includes conserved residues at specified positions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated polypeptide comprising leptin-related OB3 peptide sequence capable of modulating body mass, useful for treating or preventing obesity, Type II diabetes mellitus or hyperglycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated polypeptide (I) comprising a leptin-
related OB3 peptide sequence, where at least one of the amino acid is in
the D-isoform. The polypeptide reduces food intake and blood glucose.
This sequence corresponds to amino acids 116-123 of the mouse leptin
spondylitis, myasthenia gravis (MG), bullous pemphigoid, pemphigus, qolometulonephritis, Goodpasture's syndrome, autoinmune hemolytic anemia, Hashimoto's disease, pernicious anaemia, idiopathic thrombocytopenic purpura, Grave's disease, and Addison's disease. The invention defines postitions within a motif enabling the selection of the peptides, which will bind efficiently to human leukocyte anitgen (HLA) A2.1. This is the amino acid sequence of an immunogenic HLA-A2.1 binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       anorectic; antidiabetic; anabolic; body mass modulator; insulin release modulator; leptin; OB3 peptide; food intake reduction; blood glucose reduction; mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention describes a pharmaceutical composition (PI) comprises a carrier and a peptide (AI) capable of binding an HLA-A2.1 molecule and carrier and a peptide (AI) capable of binding an HLA-A2.1 molecule and carrier and a peptide (AI) capable of binding an HLA-A2.1 molecule and composition (CI) comprising an immunogenic peptide having an HLA-A2.1 binding motif and 9 residues selected from either first conserved composition in the Nucreminus and second conserved residues selected from V, L, I, A and M at the carbon-terminal position; or first conserved residue selected from A or M at the C-terminus; and a second conserved residue selected from A or M at the C-terminal position; and a composition (C2) comprising an immunogenic peptide having an HLA-A2.1 crossidue selected from L, M, I, V, A, or T at the second position; and a second conserved residue selected from V, I, L, A or M inding motif and a second conserved residue selected from V, I, L, A or M inding selected major histocompatibility complex. (MHC) molecules and separated by 7 residues. Also disclosed are new peptides capable of the treatment of human viral diseases (e.g. prostate cancer, conducing an immune response. The pharmaceutical compositions are useful for the treatment of human viral diseases (e.g. prostate cancer, chepatitis B, hepatitis C, AIDS, renal carcinoma, carvical carcinoma, cytomegalovirus and condylyloma acuminatum), cancers or autoimmune diseases, and to relieve the symptoms of, treat or prevent the catoimmune diseases, and to relieve the symptoms of solutions, polymyositis, courrence or reoccurrence of autoimmune diseases, e.g. multiple solarosis
                                                                                                                                                                                                         w cytostatic; virucide; immunosuppressive; anti-HIV; hepatotropic;
antinflammatory; neuroprotective; antirheumatic; antiarthritic;
Adermatological; muscular; nephrotropic; antianemnic; thyromimetic;
A haemostatic; anabolic; hypertensive; antithyroid; HLA-A2.1 binder;
A major histocompatibility complex; MHC; human viral disease;
A major histocompatibility complex; MHC; human viral disease;
A major histocompatibility complex; MHC; human viral disease;
A cervical carcinoma; lymphoma; cytomegalovirus; condylyloma acuminatum;
A cancer; autoimmune disease; multiple sclerosis; rheumatoid arthritis;
A sjogrem syndrome; scleroderma; polymyositis; dermatomyositis;
A systemic lupus erythematosus; juvenile rheumatoid arthritis;
A plomernlonephritis; Moodpasture's syndrome;
A mkylosing spondylitis; myasthenia gravis; bullous pemphigoid; pemphigus;
A dlomernlonephritis; Goodpasture's syndrome;
A autoimmune haemolytic anaemia; HLA-A2.1 binding assay.
T cell activation; poly-A-binder; HLA-A2.1 binding assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition useful for treating viral disease, autoimmune disease and cancer comprises a peptide capable of binding HLA-A2.1 molecule and inducing an immune response.
                                                                                                                                                                    HLA-A2.1 binding assay poly-A-binder peptide #4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 5; Page 12; 36pp; English.

The invention relates to a novel isolated, synthetic or recombinant peptide or polypeptide which includes one or more endothelial cell binding protein (ECBP) sequences. A peptide of the invention has anticumour, cytostatic, vasotropic, antiphsoriatic, dermatological, cumour, cytostatic, vasotropic, antiarthritic, vulnerary, antiulcer, ophthalmological, antidiabetic, antiarthritic, vulnerary, antiulcer, ophthalmological, antidiabetic, antiarthritic, vulnerary, antiulcer, is useful for promoting, reducing the proliferation and/or migration of endothelial cells, by treating the proliferation and/or migration of careated cells, and for reducing or promoting angiogenesis, by treating the cells with an ECBP antagonist, which is preferably the peptide of the invention is also useful for manufacturing a invention. A peptide of the invention is also useful for manufacturing a medicament for promoting angiogenesis, by admixing an ECBP agonist or more sites in a treated mammal. The medicament is useful for promoting or reducing
                                                                                                                                                                                                                                                                                                       ö
dermatomyositis, systemic lupus erythematosus, juvenile rheumatoid arthritis, ankylosing spondylitis, myasthenia gravis, bullous pemphigoid, pemphigus, glomerulonephritis, Goodpastures a syndrome, autoimmune haemolytic anaemia, Hashimoto's disease, pernicious anaemia, idiopathic thrombocytopenic purpura, Grave's disease, and Addison's disease. The compositions are capable of specifically binding glycoproteins encoded by HLA-A2.1 allele and inducing T cell activation in T cells restricted by the A2.1 allele. This is the amino acid sequence of a poly-A-binder peptide used for HLA-A2.1 binding assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               proliferation and/or migration of endothelial cells, and for modulating angiogenesis, has endothelial cell binding protein sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an active immunization against angiogenic proteins comprising administration of a vaccination composition (A) optionally containing an adjuvant, that comprises polypeptides (I) directly associated with an increase in angiogenesis, their variants, or their encoding polynucleotides (II). Angiogenesis-associated polypeptides are: members of the vascular endothelial growth factor (VEGF) family, especially the 121, 165 or 189 isoforms of VEGF-A, the 167 isoform of VEGF, or VEGF-C or -D; a (Co-)receptor of VEGF, particularly VEGFR-1, 2 or -3; NRP-1 or -2 (members of the neuropilin family); or placental growth factor. (A) is used for traentent or prevention of tumors in mammals, particularly humans but also farm animals and pets, also many other conditions associated with excessive angiogenesis, specifically
                                                                                                        ö
angiogenesis. ECBP sequences are useful to alter the infectivity spectrum of a viral particle. The present sequence represents an ECBP of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
malignant or benign neoplasias (and their metastases), acute or chronic inflammation, autoimmunity and eye diseases (claimed). Among the diseases that may be treated are arthritis, endometriosis, arteriosclerosis, edema, infectious diseases (hepatitis and Kaposi sarcoma), diabetes, psoriasis, rheumatoid arthritis, thyroiditis, diabetic retinopathy, transplant rejection, macular degeneration, neovascular glaucoma, hemangioma and angiofibroma. The method destroys calls that are the source of angiogenic proteins, rather than just neutralizing the activity of such proteins (as in passive immunization). This sequence represents an immunisation peptides of the invention derived from the VEGF proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated polypeptide comprising leptin-related OB3 peptide sequence capable of modulating body mass, useful for treating or preventing obesity, Type II diabetes mellitus or hyperglycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polypeptide (I) comprising a leptin-
related OB3 peptide sequence, where at least one of the amino acid is in
the D-isoform. The polypeptide reduces food intake and blood glucose.
This sequence corresponds to amino acids 116-124 of the mouse leptin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       anorectic; antidiabetic; anabolic; body mass modulator; insulin release modulator; leptin; OB3 peptide; food intake reduction; blood glucose reduction; mouse.

                                                                                                                                               US-09-839-542B-1614
; Sequence 3614, Application US/09839542B
; Sequence 3614, Application US/09839542B
; Patent No. 6569996
; GENERAL INFORMATION:
; APPLICANT: Blaschuk, Orest W.
; APPLICANT: Symonds, James Matthew
; APPLICANT: Symonds, James Matthew
; TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING NONCLASSICAL
; TITLE OF INVENTION: CAPHERIN-MEDIATED FUNCTIONS
; FILE REFERENCE: 100086.407D1
; CURRENT FILING DATE: 2001-04-20
; NUMBER OF SEQ ID NOS: 4052
; SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              OTHER INFORMATION: Representative cyclic modulating agent based on OTHER INFORMATION: cadherin-related neuronal receptor cell adhesion CTHER INFORMATION: recognition sequence US-09-839-542B-3614

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vBGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

recyclisation are used to interfere with angiogenesis, necessation are used to interfere with angiogenesis, necessoral arisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, necessoral arisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced necovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced necovascular sequelae, hypertension induced necovascular sequelae, hypertension induced necovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritomal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one bloidgical activity induced by VEGK, VEGK, VEGK, Cor-D and are also used in combination with an anti-inflammatory agent, to treat a signal contains of the contains and architits, psoriasis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             peptides by in vivo peptides linked to a
involves administering a phage display library to a subject, and identifying expressed peptides which home to the desired organ or tissue, e.g. brain, kidney, angiogenic vascular tissue or tumour tissue. The isolated peptides (see AAW1311-52, AW11181-86) can be used to target e.g. drugs, toxins or labels to the selected organ/tissue (claimed) or to identify and/or isolate target molecules (claimed). The peptides can be directly identified in vivo, as compared to prior art in vitro screening methods, which require further examination to see if they maintain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a mouse kidney homing peptide. This sequence was identified by using in vivo panning to screen a library of potential organ homing molecules. The present sequence can be used to direct a moiety to a kidney tissue, by linking the moiety to the present sequence. Examples of potential moieties are drugs, toxins or a detectable label
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kidney; homing peptide; organ targeting; tissue targeting; mouse; cyclic.

The present invention relates to a method of recovering molecules that home to a selected organ or tissue. The method comprises administering to the subject the library of diverse molecules, collecting a sample of the selected organ or tissue (e.g. brain or kidney), and recovering from the sample several molecules that home to the selected organ or tissue. The method is useful for identifying molecules, particularly useful for molecules for a period or a sample several molecules for a selected organ or tissue. The specific organ. The identified molecule is useful for e.g. raising an appropriate molecule, targeting a desired molecule for the selected organ. Specifically, the method is useful for identifying the presence of cancer in a subject by inking an appropriate molecy to a tumour homing molecules that capecifically home to a selected organ and, therefore provides a direct means for identifying molecules that a molecule identified using an in vitro screening method subsequently be examined to determine if it maintains its specificity in vivo. ANU10724-ANU10733 represent kidney homing peptides described in the present
                                                                                                                                                                                                                                                                                                                                                                                      Recovering molecules that home to an organ or tissue, useful for identifying molecules that home to a specific organ or tissue, e.g. identifying a tumor homing molecule to identify the presence of cancer, by in vivo panning of a library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Targeting ligand; bioactive agent; polymer matrix; cancer; cytostatic;
                                                Organ targeting; tissue targeting; cancer; tumour homing molecule; delivery of target molecule; kidney homing peptide.
                  Kidney homing peptide #1 useful for delivery of target molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     73.8%; Score 31; DB 5; Length 7; 57.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an enriched library fraction containing molecules that selectively home to a selected organ or tissue such as brain, kidney or tumour recovered by in vivo panning. The invention generally relates to the field of molecular medicine, drug delivery and to a method of invivo panning for identifying a molecule that homes to a specific organ. The molecules, e.g., peptidies, peptidominetics, proteins and fragments of proteins contained in an enriched library fraction may be administered to a subject as part of a pharmaceutical composition to from bacteriophage targetted to kidney. The present invention describes a chimeric retrovirus envelope protein (1) comprising an ecotropic envelope protein and a heterologous short comprising an ecotropic envelope protein. Also described: (1) a nucleic acid molecule comprising a sequence encoding the chimeric comprising a sequence encoding the chimeric envelope protein; (3) a recombinant retroviral particle comprising a fundance envelope protein (3) a recombinant retroviral particle comprising a fullmeric envelope protein comprising a control for tretroviral particle comprising a fundance encoding the chimeric envelope protein comprising a control for tretroviral tropism; (4) a leterologous short peptide ligand; (3) altering retroviral tropism; (4) identifying a nucleic acid sequence encoding the chimeric envelope protein comprising a protein that alters viral tropism; (5) delivering a nucleic acid sequence to a cell; and (6) treating cancer. (1) has cytostatic activity and can be used in gene therapy. The chimeric retrovirus envelope protein is cuseful for treating cancer, which comprises providing a cancer cell, e.g. thuman cancer cell and infecting the cancer cell with a virus, e.g. cerrovirus comprising the chimeric envelope protein comprising a cercovirus comprising the chimeric envelope protein comprising a cherapeutically useful gene, e.g. encoding thymidine kinase. The present sequence represents a kidney cell interpretation of the present
                                                                                                                                                                                                                                                                                                                      New chimeric retrovirus envelope protein comprising an ecotropic envelope protein and a heterologous short peptide ligand inserted within the ecotropic envelope protein useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chimeric retrovirus envelope protein; ecotropic envelope protein; cytostatic; gene therapy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        73.8%; Score 31; DB 7; Length 7; 57.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a composition comprising a bioactive agent homogeneously dispersed in a targeted matrix (polymer and targeting ligand). Also included are a targeted matrix for use as a delivery vehicle comprising a polymer associated with a targeting ligand, enhancing the bioavailability of an agent comprising administration of the composition. The method is useful for targeted delivery of a drug, especially in cancer therapy. The targeting ligand may be a peptide. Examples of targeting peptides are disclosed including cathepsin-D. Examples of targeting peptides are disclosed including cathepsin-D. Examples targeting peptides targeting receptors in the brain and kidney, peptides targeting the RGD (Arg-Gly-Asp)-motif in, e.g., antibodies, peptides targeting the angiogenic endothelium of solid tumours, tissue specific peptides (e.g. of lung, skin, pancreas, intestine, userus). Conseent sequence is a peptide targeting ligand disclosed in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
cathepsin-D substrate; peptides; neuroreceptor; adrenal receptor; fibronectin; vitronectin; integrin; RGD motif; angiogenic endothelium; tumour; cationic cancer-targeting peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Targeted delivery system comprising a bioactive agent homogeneously dispersed in a targeted matrix is especially useful in cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chimeric retrovirus envelope protein; ecotropic envelope protein; cytostatic; gene therapy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

(1) comprising an ecotropic envelope protein and a heterologous short peptide ligand inserted within the ecotropic envelope protein. Also described: (1) a nucleic acid molecule comprising a sequence encoding the recombinant chimeric envelope protein; (2) a vector comprising a nucleic acid sequence encoding the chimeric envelope protein; (3) a recombinant certoviral particle comprising a chimeric envelope protein comprising a heterologous short peptide ligand; (3) altering retroviral tropism; (4) identifying a nucleic acid sequence encoding the chimeric envelope protein that alters viral tropism; (5) delivering a nucleic acid sequence of a cell; and (6) treating cancer. (1) has cytostatic acitivity and can be used in gene therapy. The chimeric retrovirus envelope protein is useful for treating cancer. (1) has cytostatic acitivity and can be used in gene therapy. The chimeric retrovirus envelope protein is custovirus comprising the chimeric comprises providing a cancer cell, e.g. retrovirus comprising the chimeric envelope protein comprising a chimeric enve
                                                                                                                                           New chimeric retrovirus envelope protein comprising an ecotropic envelope protein and a heterologous short peptide ligand inserted within the ecotropic envelope protein useful for treating cancer.
                                                                                                                                                                                                                                                                                      present invention describes a chimeric retrovirus envelope protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Phage peptide display library derived kidney homing peptide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     In vivo panning; screening; phage peptide display library.
